General and Specific Mental Abilities Dennis J. McFarland 2020-05-07 The history of testing mental abilities has seen the dominance of two contrasting approaches, psychometrics and neuropsychology. These two traditions have different theories and methodologies, but overlap considerably in the tests they use.

Historically, psychometrics has emphasized the primacy of a general factor, while neuropsychology has emphasized specific abilities that are dissociable. This issue about the nature of human mental abilities is important for many practical concerns. Questions such as gender, ethnic, and age-related differences in mental abilities are relatively easy to address if they are due to a single dominant trait. Presumably such a trait can be measured with any collection of complex cognitive tests. If there are many specific mental abilities, these would be much harder to measure and associated social issues would be more difficult to resolve. The relative importance of general and specific abilities also has implications for educational practices. This book includes the diverse opinions of experts from several fields including psychometrics, neuropsychology, speech language and hearing, and applied psychology.

Suicide Science Thomas Joiner 2007-05-08 Suicide kills and maims victims; traumatizes loved ones; preoccupies clinicians; and costs health care and emergency agencies fortunes. It should therefore demand a wealth of theoretical, scientific, and fiduciary attention. But in many ways it has Why? Although the answer to this question is multi-faceted, this volume not. supposes that one answer to the question is a lack of elaborated and penetrating theoretical approaches. The authors of this volume were challenged to apply their considerable theoretical wherewithal to this state of affairs. They have risen to this challenge admirably, in that several ambitious ideas are presented and developed. If ever a phenomenon should inspire humility, it is suicide, and the volume's authors realize this. Although several far-reaching views are proposed, they are pitched as first approximations, with the primary goal of stimulating still more conceptual and empirical work. A pressing issue in suicide science is the topic of clinical interventions, and clinical approaches more generally. Here too, this volume contributes, covering such topics as therapeutics and prevention, comorbidity, special populations, and clinical risk factors.

Motivation and Child Maltreatment David J. Hansen 2000 In this volume, the concept of motivation is used to shed light on a range of complex issues surrounding the maltreatment of children. Cathy Spatz Widom investigates the role of motivation in the intergenerational transmission of violence, where victimized children themselves become perpetrators of violence as adults. Joel S. Milner looks at the way abusive parents process social information related to children. The biological, psychological, and social-contextual regulatory processes in maltreated children are considered by Dante Cicchetti and Sheree L. Toth. Deborah Daro discusses the current status of efforts to eliminate maltreatment of children and offers an alternative model for approaching the concept and practice of prevention. John R. Lutzker addresses the challenges of and procedures for applied research on the treatment of abusive parents. In his concluding essay Ross A. Thompson highlights the important themes focusing on child maltreatment that underlie this volume. David J. Hansen is a professor of psychology and director of the Clinical Psychology Training Program at the University of Nebraska.

Depression in Children's Lives Keith Crnic 2021-08-31 Although childhood depressive disorders are relatively rare, the experience of depression in children's lives is not. Developmental contextual perspectives denote the importance of considering both depressive disorder and the experience of subclinical depressive symptoms in the child and the family to fully understand the implications of depressive experience for children's developmental well-being. This Element draws on basic emotion development and developmental psychopathology perspectives to address the nature of depressive experience in childhood, both symptoms and disorder, focusing on seminal and recent research that details critical issues regarding its phenomenology, epidemiology, continuity, etiology, consequences, and interventions to ameliorate the developmental challenges inherent in the experience. These issues are addressed within the context of the child's own experience and from the perspective of parent depression as a critical context that influences children's developmental well-being. Conclusions include suggestions for new

directions in research on children's lives that focus on more systemic processes.

Personality at Work Adrian Furnham 2002-09-11 Personality at Work examines the increasingly controversial role of individual differences in predicting and determining behaviour at work. It asks whether psychological tests measuring personality traits can predict behaviour at work, such as job satisfaction, productivity, as well as absenteeism and turnover. Importantly, it is a critical and comprehensive review of that literature from psychology, sociology and management science which lies at the interface of personality theory, occupational psychology and organizational behaviour. Drawing on a vast body of published material, Adrian Furnham describes for the first time current state of knowledge in this area. The result is a volume which will be an enormously useful resource to the researcher and practitioner, as well as students of psychology, management science and sociology. Personality at Work is the only exhaustive and incisive multi-disciplinary work to assess the role of psychological testing in the management of the work place.

Reversible Computation: Extending Horizons of Computing Irek Ulidowski 2020-01-01 This open access State-of-the-Art Survey presents the main recent scientific outcomes in the area of reversible computation, focusing on those that have emerged during COST Action IC1405 "Reversible Computation - Extending Horizons of Computing", a European research network that operated from May 2015 to April 2019. Reversible computation is a new paradigm that extends the traditional forwards-only mode of computation with the ability to execute in reverse, so that computation can run backwards as easily and naturally as forwards. It aims to deliver novel computing devices and software, and to enhance existing systems by equipping them with reversibility. There are many potential applications of reversible computation, including languages and software tools for reliable and recovery-oriented distributed systems and revolutionary reversible logic gates and circuits, but they can only be realized and have lasting effect if conceptual and firm theoretical foundations are established first.
